

HOW ARE WE DOING?

Valley Hospital
Adult Inpatient Unit

Valley Hospital's Adult Inpatient unit uses the CQI+ Outcomes Measurement System to monitor outcomes for change in clinical symptomatology and patient satisfaction.

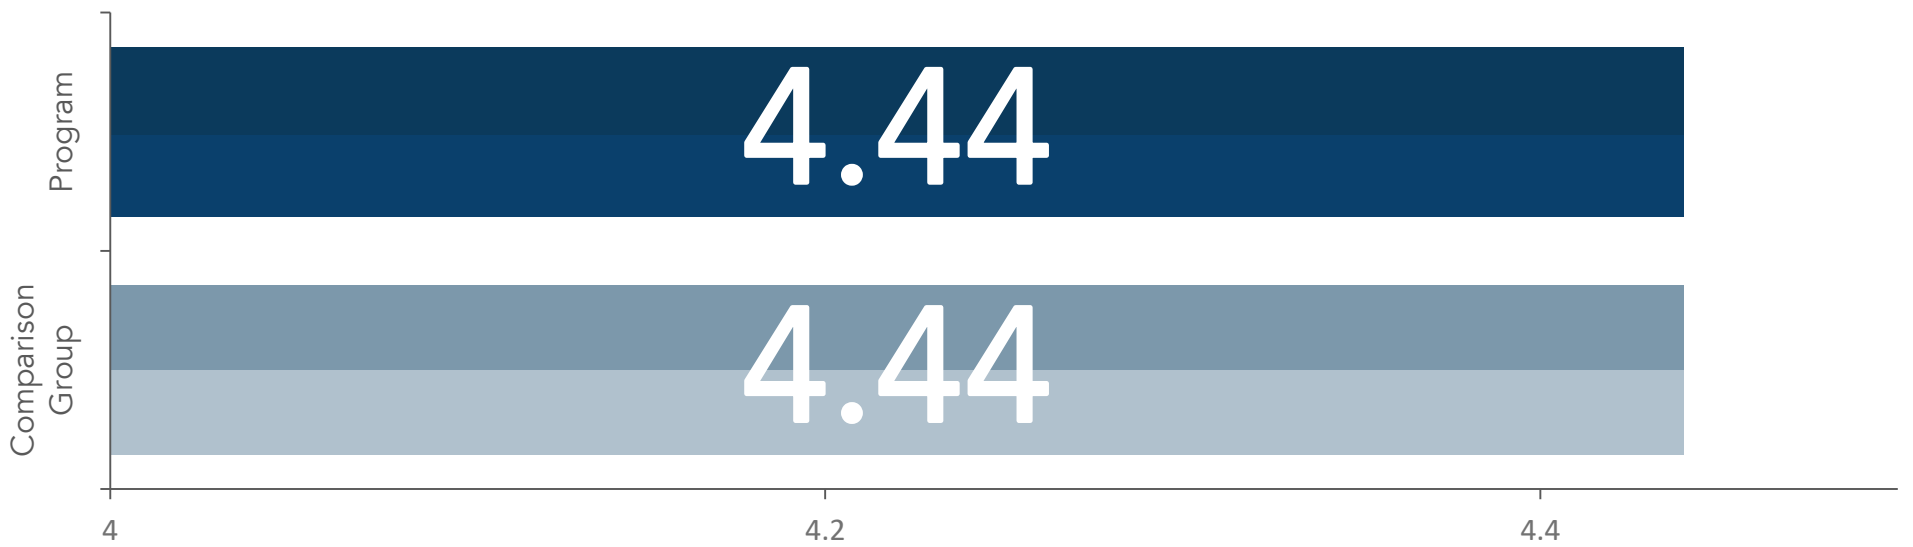

Change in Depression

PHQ-9 Change Scores (Scale of -27 to 27) - positive scores indicate improvement. The treatment program demonstrates greater average satisfaction compared to the UHS comparison group. Improvement percentages are calculated by evaluating each patient's change score for statistically meaningful change indicating statistical evidence of their change being due to effects of treatment.

Overall Patient Satisfaction

Patient Satisfaction is measured on a scale from 1 (Strongly Disagree) - 5 (Strongly Agree). The treatment program demonstrates similar average satisfaction compared to the UHS comparison group.

Would You Recommend?

87% of patients would recommend the program to family members or friends who needed similar treatment.
